

We claim:

- 1 1. A machine-readable medium that provides instructions, which when executed by a set
2 of processors, cause said set of processors to perform operations comprising:
3 receiving a signal; and
4 synchronization hunting concurrently for a first and second frame alignment pattern
5 for a first and second alignment candidates.
- 1 2. The machine-readable medium of claim 1 wherein the first and second alignment
2 candidates are stored in a set of per-alignment state machines.
- 1 3. The machine-readable medium of claim 1 wherein the first frame alignment pattern
2 for the first alignment candidate coincides with the second frame alignment pattern for the
3 second alignment candidate.
- 1 4. The machine-readable medium of claim 1 further comprising:
2 receiving a second signal simultaneously with the signal; and
3 synchronization hunting concurrently for the first and second frame alignment pattern
4 for a third and fourth alignment candidates of the second signal.
- 1 5. The machine-readable medium of claim 1 further comprising:
2 receiving a second signal simultaneously with the signal, the second signal being a
3 different format than the signal; and
4 synchronization hunting the second signal.
- 1 6. A machine-readable medium that provides instructions, which when executed by a set
2 of processors, cause said set of processors to perform operations comprising:

5 hunting for a first alignment signal within the first signal in a first time slice;
6 resetting the set of per-alignment state machines after the first time slice; and
7 hunting for a second alignment signal within the second signal in a second time slice.

1 11. The machine-readable medium of claim 10 wherein the first alignment signal
2 coincides with a third alignment signal for a first and second one of the per-alignment state
3 machines.

1 12. The machine-readable medium of claim 10 wherein the second alignment signal
2 coincides with a fourth alignment signal for a first and second one of the per-alignment state
3 machines.

1 13. The machine-readable medium of claim 10 further comprising:
2 hunting for a third alignment signal within the first signal in concurrence with the
3 hunting for the first alignment signal in the first signal in the first time slice;
4 and
5 hunting for the third alignment signal within the second signal in concurrence with
6 the hunting for the second alignment signal within the second signal in a
7 second time slice.

1 14. The machine-readable medium of claim 10 further comprising:
2 hunting for a third alignment signal within the first signal in concurrence with the
3 hunting for the first alignment signal in the first signal in the first time slice;
4 and
5 hunting for a fourth alignment signal within the second signal in concurrence with the
6 hunting for the second alignment signal within the second signal in a second
7 time slice.

1 15. A machine-readable medium that provides instructions, which when executed by a set
2 of processors, cause said set of processors to perform operations comprising:

3 receiving a first and second signal;

4 initializing a set of per-alignment state machines;

5 hunting for a first alignment signal in the first signal for a first one of the set of per-
6 alignment state machines in concurrence with hunting for a second alignment
7 signal in the first signal for a second one of the set of per-alignment state
8 machines in a first time slice;

9 resetting the set of per-alignment state machines after the first time slice; and

10 hunting for a third alignment signal in the second signal for a third one of the set of
11 per-alignment state machines in concurrence with hunting for a fourth
12 alignment signal in the second signal for a fourth one of the set of per-
13 alignment state machines in a second time slice.

1 16. The machine-readable medium of claim 15 wherein the first and second alignment
2 signals coincide for the first and second one of the set of per-alignment state machines and
3 the first and second alignment signal coincide for the third and fourth one of the set of per-
4 alignment state machines.

1 17. The machine-readable medium of claim 15 wherein the first and second signal have
2 the same formatting.

1 18. The machine-readable medium of claim 15 wherein the first and second signal have
2 different formatting.

1 19. A machine-readable medium that provides instructions, which when executed by a set
2 of processors, cause said set of processors to perform operations comprising:

3 sync hunting for a first layer format of a signal;
4 finding alignment of the signal for the first layer format; and
5 resetting sync hunting for a second layer format of the signal in response to finding
6 alignment of the signal for the first layer format.

1 20. The machine-readable medium of claim 19 further comprising:
2 resetting sync hunting for the first layer format for a second signal;
3 sync hunting for the first layer format of the second signal;
4 finding alignment of the second signal for the first layer format; and
5 resetting sync hunting for the second layer format of the second signal in response to
6 finding alignment of the second signal for the first layer format.

1 21. The machine-readable medium of claim 19 further comprising:
2 resetting sync hunting for the first layer format for a second signal;
3 sync hunting for the first layer format of the second signal;
4 finding alignment of the second signal for the first layer format; and
5 resetting sync hunting for a third layer format of the second signal in response to
6 finding alignment of the second signal for the first layer format.

1 22. The machine-readable medium of claim 19 further comprising:
2 resetting sync hunting for a third layer format for a second signal;
3 sync hunting for the third layer format of the second signal;
4 finding alignment of the second signal for the third layer format; and
5 resetting sync hunting for a fourth layer format of the second signal in response to
6 finding alignment of the second signal for the third layer format.

1 23. An apparatus comprising:
2 a domain clock to transmit a clock signal;
3 a first and second receiving unit coupled to the domain clock, the first and second
4 receiving unit to receive a first and second signal;
5 a selecting unit coupled to the first and second receiving unit, the selecting unit to
6 synchronize the first and second signal with the clock signal and cycle
7 between transmitting the first and second signal as a third signal;
8 a first memory unit coupled to the selecting unit, the first memory unit to receive the
9 second signal and store a set of counters and a global state machine;
10 a second memory unit coupled to the first memory unit, the second memory unit to
11 store a set of per-alignment state machines; and
12 a sync hunting logic coupled to the selecting unit, first memory unit and second
13 memory unit, the sync hunting logic to sync hunt the third signal with the set
14 of per-alignment state machines, global state machines, and the set of counters
15 and to feed a set of output to the first and second memory unit.

1 24. The apparatus of claim 23 wherein the first and second signals have different formats.

1 25. The apparatus of claim 23 wherein the first and second signals are received at
2 different rates.

1 26. The apparatus of claim 23 wherein the second signal is a set of signals.

1 27. The apparatus of claim 23 wherein the domain clock outruns a combined rate of the
2 first and second signal.

10374360

1 28. The apparatus of claim 23 wherein the sync hunt logic sync hunts a first and second
2 frame alignment pattern concurrently.

1 29. An apparatus comprising:
2 a set of parallel registers to store a set of bits from a signal;
3 a set of counters coupled to the set of parallel registers, the counters to count the set
4 of bits;
5 a first memory unit coupled to the set of parallel registers and the set of counters, the
6 first memory unit to store a global state machine;
7 a second memory unit coupled to the first storage, the second memory unit to store a
8 set of per-alignment state machines; and
9 a sync hunt logic coupled to the set of parallel registers, the first memory unit, and the
10 second memory unit, the sync hunt logic to sync hunt the signal in a clock
11 domain with the set of per-alignment state machines and the global state
12 machine, and feed a set of information to the first and second memory unit.

1 30. The apparatus of claim 29 wherein the sync hunt logic concurrently hunts for a first
2 and second frame alignment pattern in the signal for a first and second one of the set of per-
3 alignment state machines.

1 31. The apparatus of claim 29 wherein a rate of the clock domain is faster than a rate of
2 the signal.

1 32. The apparatus of claim 29 further comprising:
2 a first and second receiving unit, the first and second receiving unit to receive a first
3 and second signal and synchronize the first and second signal in the clock
4 domain; and

1 36. The apparatus of claim 33 further comprising:
2 a first and second receiving unit , the first and second receiving unit to receive a first
3 and second signal and synchronize the first and second signal in the clock
4 domain; and
5 a multiplexing unit coupled to the first set of registers and the first and second
6 receiving unit, the multiplexing unit to multiplex the first and second signal
7 and transmit the multiplexed first and second signal as the signal to the first
8 set of registers.

1 37. An apparatus comprising:
2 a receiving unit to receive a signal;
3 a first memory unit coupled to the receiving unit, the first memory unit to store a set
4 of counters and a global state machine;
5 a second memory unit coupled to the receiving unit and the first memory unit, the
6 second memory unit to store a set of per-alignment state machines; and
7 a sync hunt logic coupled to the receiving unit, first memory unit and second memory
8 unit, the sync hunt logic to concurrently hunt for a first and second framing
9 signal in the signal and feed a set of information to the first and second
10 memory unit.

1 38. The apparatus of claim 37 wherein the signal is a multiplexed signal.

1 39. The apparatus of claim 37 wherein the first and second framing signal coincide for a
2 first one and second one of the set of per-alignment state machines.

1 40. The apparatus of claim 37 wherein a first one and second one of the set of per-
2 alignment state machines are accessible simultaneously.

1 45. The apparatus of claim 42 wherein the domain clock runs at a rate faster than a
2 combined rate of the first and second signal.

1 46. An apparatus comprising:
2 a domain clock to transmit a clock signal;
3 a first receiving unit coupled to the domain clock, the first receiving unit to receive a
4 first signal and to synchronize the signal to the clock signal;
5 a second receiving unit coupled to the domain clock, the second receiving unit to
6 receive a second signal and to synchronize the second signal to the clock
7 signal;
8 a first memory unit coupled to the first receiving unit, the first memory unit to store a
9 first set of counters and a first global state machine;
10 a second memory unit coupled to the first memory unit, the second memory unit to
11 store a first set of per-alignment state machines;
12 a first sync hunt logic coupled to the first and second memory unit and the first
13 receiving unit, the first sync hunt logic to sync hunt the first signal and feed an
14 output to the first and second memory unit;
15 a multiplexing unit coupled to the first and second receiving unit, the multiplexing
16 unit to multiplex the first and second signal in accordance with the clock
17 signal;
18 a third memory unit coupled to the multiplexing unit and the first sync hunt logic, the
19 third memory unit to store a second set of counters and a second global state
20 machine;
21 a fourth memory unit coupled to the third memory unit, the fourth memory unit to
22 store a second set of per-alignment state machines; and

23 a second sync hunt logic coupled to the multiplexing unit and third and fourth
 24 memory unit, the second sync hunt logic to sync hunt the multiplexed first and
 25 second signal and feed an output to the third and fourth memory unit.

1 47. The apparatus of claim 46 wherein the first set of per-alignment state machines is
 2 organized for simultaneous accessibility of a first and second one of the first set of per-
 3 alignment state machines.

1 48. The apparatus of claim 46 wherein the second set of per-alignment state machines is
 2 organized for simultaneous accessibility of a first and second one of the second set of per-
 3 alignment state machines.

1 49. The apparatus of claim 46 wherein the first sync hunt logic concurrently hunts for a
 2 first and second frame alignment pattern for a first and second one of the first set of per-
 3 alignment state machines.

1 50. The apparatus of claim 46 wherein the second sync hunt logic concurrently hunts for
 2 a first and second frame alignment pattern for a first and second one of the second set of per-
 3 alignment state machines.

1 51. The apparatus of claim 46 further comprising:
 2 the first sync hunt logic to transmit a feed forward signal to the second global state
 3 machine when the first sync hunt logic determines alignment for the first
 4 signal; and
 5 the second global state machine to reset the second set of per-alignment state
 6 machines in response to the feed forward signal.

1 52. An apparatus comprising:
2 a first format sync hunt logic to sync hunt a signal for a first layer format and transmit
3 a feed forward signal when the first layer format is determined for the signal;
4 a global state machine coupled to the first format sync hunt logic, the global state
5 machine to reset a second layer format sync hunt logic in response to the feed
6 forward signal; and
7 the second format sync hunt logic coupled to the global state machine and the first
8 format sync hunt logic; the second format sync hunt logic to sync hunt the
9 signal for a second layer format.

1 53. The apparatus of claim 52 wherein the first format sync hunt logic hunts concurrently
2 for a first and second framing pattern of the first layer format.

1 54. The apparatus of claim 52 further comprising:
2 a domain clock to transmit a clock signal;
3 a first and second receiving unit coupled to the domain clock, the first and second
4 receiving unit to receive a second and third signal and to synchronize the
5 second and third signal in accordance with the clock signal; and
6 a multiplexing unit coupled to the first format sync hunt logic and the first and second
7 receiving unit, the multiplexing unit to multiplex the second and third signal
8 and transmit the multiplexed second and third signal as the signal to the first
9 format sync hunt logic.

1 55. An apparatus comprising:
2 a data structure to store a set of DS3 per-alignment state machines, the per-alignment
3 state machines organized into two columns of eighty-five DS3 per-alignment
4 state machines;

5 a logic coupled to the data structure, the logic to process the set of DS3 per-alignment
6 state machines and to update the set of DS3 per-alignment state machines.

1 56. The apparatus of claim 55 further comprising a global state machine coupled to the
2 data structure, the global state machine to control the set of DS3 per-alignment state
3 machines.

1 57. An apparatus comprising:
2 a data structure to store a set of DS2 per-alignment state machines, the per-alignment
3 state machines organized into three columns of forty-nine DS2 per-alignment
4 state machines;
5 a logic coupled to the data structure, the logic to process the set of DS-2 per-
6 alignment state machines.

1 58. The apparatus of claim 57 further comprising a global state machine coupled to the
2 data structure, the global state machine to control the set of DS2 per-alignment state
3 machines.

1 59. A computer implemented method comprising:
2 receiving a signal; and
3 synchronization hunting concurrently for a first and second frame alignment pattern
4 for a first and second alignment candidates.

1 60. The computer implemented method of claim 59 wherein the first and second
2 alignment candidates are stored in a set of per-alignment state machines.

1 61. The computer implemented method of claim 59 wherein the first frame alignment
2 pattern for the first alignment candidate coincides with the second frame alignment pattern
3 for the second alignment candidate.

1 62. The computer implemented method of claim 59 further comprising:
2 receiving a second signal simultaneously with the signal; and
3 synchronization hunting concurrently for the first and second frame alignment pattern
4 for a third and fourth alignment candidates of the second signal.

1 63. The computer implemented method of claim 59 further comprising:
2 receiving a second signal simultaneously with the signal, the second signal being a
3 different format than the signal; and
4 synchronization hunting the second signal.

1 64. A computer implemented method comprising:
2 receiving a first and second signal;
3 initializing a set of per-alignment state machines;
4 hunting for a first alignment signal within the first signal in a first time slice;
5 resetting the set of per-alignment state machines after the first time slice; and
6 hunting for a second alignment signal within the second signal in a second time slice.

1 65. The computer implemented method of claim 64 wherein the first alignment signal
2 coincides with a third alignment signal for a first and second one of the per-alignment state
3 machines.

1 66. The computer implemented method of claim 64 wherein the second alignment signal
2 coincides with a fourth alignment signal for a first and second one of the per-alignment state
3 machines.

1 67. The computer implemented method of claim 64 further comprising:
2 hunting for a third alignment signal within the first signal in concurrence with the
3 hunting for the first alignment signal in the first signal in the first time slice;
4 and
5 hunting for the third alignment signal within the second signal in concurrence with
6 the hunting for the second alignment signal within the second signal in a
7 second time slice.

1 68. The computer implemented method of claim 64 further comprising:
2 hunting for a third alignment signal within the first signal in concurrence with the
3 hunting for the first alignment signal in the first signal in the first time slice;
4 and
5 hunting for a fourth alignment signal within the second signal in concurrence with the
6 hunting for the second alignment signal within the second signal in a second
7 time slice.
